## Introduction

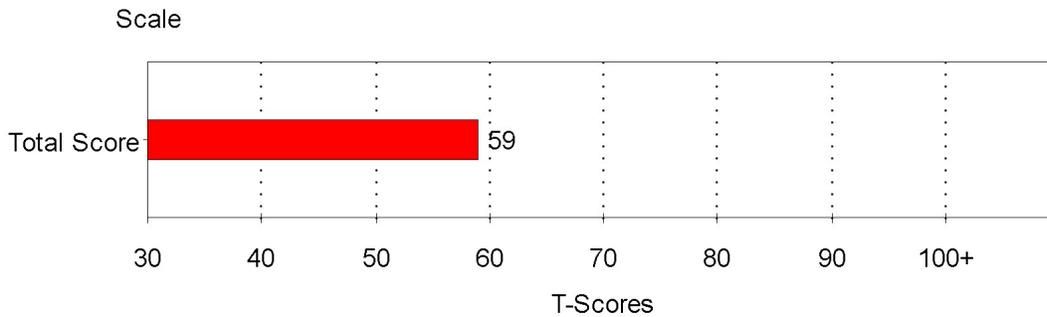

The Children’s Depression Inventory: Short Version (CDI:S) is a 10-item self-rated symptom-oriented scale suitable for youths aged 7 to 17. The CDI:S was developed to provide a psychometrically sound way to quickly screen children for depressive symptoms. CDI:S T-scores are based on a normative sample of 1266 youths and are calculated based on age (7 to 12 or 13 to 17) and gender. The CDI:S can be used when a quick screening measure is desired, when the examiner’s time with the child is limited, or other similar situations. This report provides information about the youth’s scores and how they compare with the scores of the normative sample of non-clinical individuals. See the CDI Technical Manual (published by MHS) for more information about this instrument and its results.

## Cautionary Remarks

This computerized report is meant to act as an interpretive aid and should not be used as the sole basis for intervention or clinical diagnosis. This report works best when combined with other sources of relevant information (e.g., tests, observations, historical information). The report is based on an algorithm that produces the most common interpretations for the scores that have been obtained. Atypical interpretations must be explored in other ways on a case-by-case basis. The information contained in this report should be treated as confidential.

## CDI:S T-Scores

The following graph provides John’s T-score for the CDI:S Total Score.

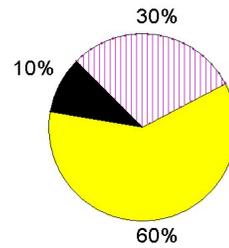

## Profile Summary

John's CDI:S raw score was 6, which translates to a T-score of 59 for a Male in the 7–12 age range.

## Item Response Table

The following response choices were entered for the items on the CDI:S.

Item #	Response
1.	1
2.	1
3.	0
4.	1
5.	1
6.	1
7.	1
8.	0
9.	0
10.	2

## Comparing Administrations

This section compares Total Scores for the different versions of the CDI. Only administrations completed within the past 2 weeks are included.

Version	Total T-score	Date/Time
CDI:S	T-score = 59	Friday, April 23, 2004, 10:36
CDI	T-score = 50	Friday, April 23, 2004, 10:21

Differences between scores of 0-4 points indicate good consistency between respondents, differences of 5-10 points indicate some divergence, and differences of 11 points or higher indicate marked differences between respondents.

## Integrating Results and Considering Intervention

CDI results must be incorporated with other information before drawing any conclusions. It is recommended that a comprehensive evaluation include direct clinical observation of the youth, information from other relevant assessments, and information about the youth's background, family history, and school adjustment.
